The AGRODOK- SERIES is a series of low-priced, practical manuals on small-scale and sustainable agriculture in the tropics. AGRODOK booklets are available in English (E), French (F), Portuguese (P) and Spanish (S). Agrodok publications can be ordered from AGROMISA or CTA.

1. Pig farming in the tropics
2. Soil fertility management
3. Preservation of fruit and vegetables
4. Small-scale chicken production
5. Fruit growing in the tropics
6. Simple construction surveying for rural applications
7. Goat keeping in the tropics
8. Preparation and use of compost
9. The home garden in the tropics
10. Cultivation of soya and other legumes
11. Erosion control in the tropics
12. Preservation of fish and meat
13. Water harvesting and soil moisture retention
14. Dairy cattle husbandry
15. Small-scale freshwater fish farming
16. Agroforestry
17. Cultivation of tomato
18. Protection of stored cereal grains and pulses
19. Propagating and planting trees
20. Back-yard rabbit keeping in the tropics
21. On-farm fish culture
22. Small-scale production of weaning foods
23. Protected cultivation
24. Urban agriculture
25. Granaries
26. Marketing for small-scale producers
27. Establishing and managing water points for village livestock
28. Identification of crop damage
29. Pesticides: compounds, use and hazards
30. Non-chemical crop protection
31. Storage of agricultural products
32. Beekeeping in the tropics
33. Duck keeping in the tropics
34. Improving hatching and brooding in small-scale poultry
35. Donkeys for transport and tillage
36. Preparation of dairy products
37. Small-scale seed production
38. Starting a cooperative
39. Non-timber forest products
40. Small-scale mushroom cultivation
41. Small-scale mushroom cultivation – 2
42. Bee products
43. Rainwater harvesting for domestic use
44. Ethnoveterinary medicine
45. Mitigating the effects of HIV/AIDS in small-scale farming
46. Zoonoses
47. Snail farming
48. Entering the organic export market
49. The Rural Finance Landscape
50. Packaging of agricultural products

Storage of agricultural products
Storage of agricultural products

Gerard Pesch
Foreword

This booklet in the Agrodok series is a major revision of Jelle Hayma’s edition from 1995. As post-harvest losses of crops are still a major issue for small-scale farmers in the tropics, we needed no further stimulation to work on the update.

The intention of this revision was to place less emphasis on all the technical facilities available to store agricultural products, and instead provide more background information on how and why products deteriorate, and how this can be delayed or reduced.

Rather than focusing only on storage of the most important staple foods (grains and pulses, root and tuber crops), a whole chapter in this edition has been devoted to fruits and vegetables. These products are not only important in the diet of a farmer’s family: they can also contribute to the farmer’s income when brought to the market in good condition.

During the preparation of this booklet we received comments from several people on how to improve the manuscript. We want to acknowledge especially the valuable input of Dr. Peter Fellows, who was simultaneously in the process of writing *Agrodok 50: Packaging of Agricultural Products*.

   5.3 Operations in the field and in a warehouse 60
   5.4 Storage of vegetables and fruits 62
1 Introduction

1.1 Reasons for a farmer to store agricultural products

This booklet discusses how agricultural products are harvested and stored by farmers. In most cases, the products are stored without further handling for a shorter or longer period. Unfortunately losses of 25 percent for stored grain crops and 40-50 percent for vegetables are not unusual in the tropics. For the farmers, these products fulfil various needs:

Seed for planting
Part of the harvest is used as propagation material for the next crop. If seeds or tubers are not stored well, some will not germinate (grow) when planted, which means the farmer will have to plant many more to get enough plants. The seed grains may also grow at different speeds, which will cause problems for cultivating and harvesting the crop.

Food for the family
It is important to have enough food, but to stay healthy it is also important to have food that is of good quality. Farmers and their families can clearly see whether they will run out of grain to eat before the next harvest, but loss of food quality is more difficult to measure. Some insects eat out the best parts of the grain, which contain the vitamins and minerals that make the food nutritious. Farmers may not see this loss, and therefore need to know how to prevent it. Lack of nutritious food can lead to many problems, including sickness and malnutrition.

Income
Farmers have to buy or barter for things they need but do not produce themselves. Most farmers sell the products they do not use for food or planting to earn money, or they trade their own products for the things they need. If farmers have only poor drying and storage facilities, they cannot keep their products safely for any period of time and are forced
to sell the products soon after harvest. The prices are low at this time because no one needs grain. Everyone is harvesting, and there is plenty of grain available. If the farmers can dry and store the products safely, they may be encouraged to grow more than they need for their families. Good grain storage can thus lead to more food, more money, better planting material, and a better future.

With this practical manual we wish to encourage small-scale farmers to improve their storage methods for grains, roots and tubers, fruits and vegetables.

1.2 Outline of the booklet

In this booklet we discuss the storage of different agricultural products. We will present storage not as a single measure, but in the context of other post-harvest activities. In the first chapter we discuss why it is important for farmers to store agricultural products.

Chapter 2 is divided into several sections. The first section (2.1) discusses how agricultural products start to deteriorate after harvesting, which makes them unsuitable for long-term storage. The maximum storage period varies per product, but in general it is longest for seeds, intermediate for most roots and tubers and shortest for some fruits and vegetables. Section 2.2 explains why the quality of harvested products quickly declines. Section 2.3 describes ways to stop or reduce these losses. Section 2.4 summarises the principles for product storage and how these can depend on the type of products to be stored and the outside conditions.

Chapters 3 – 5 are devoted to the storage of specific crops, including seeds (Chapter 3), roots, tubers and bulbs (Chapter 4) and fruits and vegetables (Chapter 5). These chapters start with an overview of the products that belong to each group of crops discussed, followed by the greatest challenges in storing these products. The third section of each chapter describes the activities that take place in the field before storage, and for some products storage in the field. The fourth section of
each chapter is devoted to preparation of storage space inside a building, the storage itself and transport to and from the storage space.
